REMINGTON ADDS NEW BULLET WEIGHTS TO THREE 7MM (28 CALIBER) ROUNDS

In 1988 Remington will offer the choice of an additional bullet weight to three of its 7mm or 28-caliber cartridges: the 7mm-08 Remington, .280 Remington and 7mm Remington Magnum.

NEW 120-GRAIN HOLLOW POINT FOR 7MM-08 REM. AND .280 REM.

The addition of a new, 120-grain hollow point bullet to both the 7mm-08 Remington and the .280 Remington increases the versatility of both these rounds.

The past few years have seen a dramatic increase in hunter recognition and appreciation of the ballistic performance of 7mm or 28-caliber cartridges. The rapidly growing demand for the .280 Remington is a good example. During the past two years it has become one of the most sought-after chamberings for new rifles, surpassing the demand in many areas for such well-established medium-bore rounds as the .270 Win. and .30-06.

Comparable preference has been growing for the 7mm-08 Remington, a short-action 7mm round. The 7mm-08 Remington

has been building its own reputation as one of the most effective short-action deer and medium game cartridges available in both carbine and standard-length barrels.

The new 120-grain hollow point loading for both rounds combines flat trajectory with excellent wind-bucking characteristics for long-range small game and varmint hunting. For example, both provide ballistic superiority to the .30-06, 125-grain load, particularly at longer ranges.

NEW 7MM REM. MAGNUM
140-GRAIN PSP LOADING

During the years following its introduction in 1962, the 7 mm Remington Magnum has created its own reputation as one of America's most effective, all-around big game cartridges. The additional option of a 140-grain loading simply increases its versatility. This is the same 140-grain bullet that has performed so well in the 7mm-08 Remington and .280 Remington.

In terms of both velocity and energy, this new 7mm Remington Magnum provides superiority over any other 140-grain loading currently produced.
